

Aventura is your closest neighborhood. To a machine you are *not there*.

A read of deflorashop.com through a machine's eyes, and a proposal to build three layers: a business AI can read, an agent that takes the order, and a system that remembers the customer and brings them back.

01 Who we are

We are not just another agency running ads. Everyone runs ads. We are one of the few doing organic promotion inside AI right now: making a business the kind that ChatGPT, Perplexity and Google's AI answers describe accurately and recommend. On top of that we put agents on the phone that take orders, and systems that remember the customer. Three of those are running for us today, all live, all with real customers inside.

Why "one of the few": promotion inside AI is about two years old and most of the market has not caught up yet. Easy to test. Ask any agency what llms.txt is.

We run ads as well. Just after there is somewhere to send the traffic and a way to count it. Paying for clicks to a page that does not exist makes no sense.

02 The short version

Your site is solid. This is not one of those cases where everything has to come down and start again, and most of the technical groundwork is in good shape. The problem is elsewhere: a machine cannot find you where your neighbors are looking, and cannot say anything useful about you when someone asks.

Already done right

Leave this alone

- ✓ **102 reviews averaging 4.74**, and marked up properly, so the stars show in Google
- ✓ **Product pages are exemplary**: price, availability, shipping, returns, all machine readable
- ✓ **A link to a bouquet unfurls properly** in WhatsApp and Instagram
- ✓ **AI crawlers are allowed in** by name. Half the shops out there are accidentally blocked and never find out
- ✓ **Addresses resolve correctly**: with and without www, http and https, all to one place
- ✓ **220 products and 53 categories**. The catalogue is alive

What it costs you

Worst first

- ✗ **22 neighborhoods next door with no page at all**, the closest of them Aventura
- ✗ **8 of the places you officially deliver to** have no page on the site at all
- ✗ **No AI card**, so ChatGPT assembles facts about you by guessing
- ✗ **A city page with a typo in the name**. The customer reads "Pembroke Pnes"
- ✗ **City pages are 90% identical**. Google treats that as filler
- ✗ **Only a human answers the phone**. Nights and weekends go unanswered
- ✗ **Nothing remembers your customers' dates**. Every repeat order gets earned from scratch

03 How we checked

By looking, not by guessing. We requested your pages the way the crawlers from Google, ChatGPT and Perplexity request them, and looked at exactly what came back. Everything below is what your site answered on 26 August.

One thing we did not measure and will not invent: your exact load speed. The measurement tool was unavailable. We will give you a number after a real test.

04 The big one: neighbors who cannot find you

Nobody in Sunny Isles searches for "flowers". They search for "flower delivery Sunny Isles", or they ask ChatGPT who delivers there today. Either way the answer gets built from a page about that specific neighborhood. You do not have one.

PAGES EXIST

14 TOWNS

Doral
Sunrise
Plantation
Coral Springs
Pembroke Pines
Davie
Oakland Park
Olympia Heights
Miami Gardens
North Miami
North Miami Beach
Miami Shores
South Miami
Coral Gables

Plus the misspelled Pembroke duplicate and 4 pages that point at a building rather than a town: a hospital, a hotel and two cemeteries. Almost all of it is the west side of the county.

NO PAGES

22 AREAS

Aventura, the closest one to you
Sunny Isles Beach
Bal Harbour
Surfside
Bay Harbor Islands
Golden Beach
Hallandale Beach
Hollywood
Miami Beach
South Beach
Brickell
Key Biscayne
Coconut Grove
Wynwood
Edgewater
Pinecrest
Kendall
Hialeah
Fort Lauderdale
Boca Raton
Weston
Miramar

This is the coastal strip beside you, where the person who buys a \$350 bouquet lives.

Separately: you already told the machine you deliver there

Your site's structured data lists a delivery area. Miami itself is covered by the home page and Miami Gardens has its own. The remaining eight places have nothing at all: you are telling a crawler "we deliver to Hallandale" and then have nothing to show when someone searches for it.

```
delivery area, as declared in your site data
Dania Beach · Golden Isles · Hallandale Beach · Hialeah
Hialeah Gardens · Hialeah Lakes · Miami Lakes · Pembroke Park

Miami Gardens      no page at all
Miami              has a page
                  covered by the home page

with no page: 8 of 10
```

And the one sitting in plain sight: Shabbat flowers

You sell Shabbat arrangements. The community that buys them lives in Surfside, Bal Harbour, Bay Harbor and Aventura, and those are precisely the neighborhoods with no page. The product exists, the buyer is a few blocks away, and nothing connects them.

05 What is wrong with the pages you do have

Fourteen city pages exist, but inside they carry the same text with the name swapped. Google recognises that and mostly stops showing it. AI services will not quote it at all, because there is nothing there to quote.

FIX FIRST

An entire city with the name misspelled

There are two Pembroke Pines pages on your site: the correct one, and one spelled **Pembroke Pnes**. The error is not buried in a URL. It sits in the page title, in the heading, and in the body text the customer reads. Your own "Where We Deliver" page links to it.

Two pages compete for one town, and some of your visitors land on the one where their city is spelled wrong. That is a trust problem before it is a ranking problem.

```
what a customer sees at /nearby/pembroke-pnes/
browser tab      Pembroke Pnes Florist | Flower Delivery...
page heading    Flower Delivery in Pembroke Pnes
linked from      /where-we-deliver/
```

FIX FIRST

Nine words in ten are the same on every city page

We took the text from five city pages, stripped out the city names, and compared them. Of roughly 1,650 meaningful words, **1,508 are shared across all five**. What differs is the city name and one opening line about "a vibrant community".

The "Best Sellers" block shows the same four bouquets at the same four prices on every page. No delivery time for the area, no knowledge of local buildings or doormen, not one fact that separates Coral Gables from Sunrise.

words shared by 5 city pages, out of ~1650

1508 ≈ 90% of the text is identical

"Best Sellers", the same on every page:

Sweet Serenity \$119 Pink Euphoria \$357

Pastel Poésie \$349 Orchid Bliss \$159

FIX FIRST

One search description for every city, and it names none of them

Under a Google result people read a short description and decide whether to click. On all of your city pages it is **the same text, it never names the city**, and it reads like a directory of other people's florists rather than your shop.

description, verbatim, on all five we checked

Doral Order fresh flowers online ... Find local flower shops...

Sunrise Order fresh flowers online ... Find local flower shops...

Coral Gables Order fresh flowers online ... Find local flower shops...

North Miami Order fresh flowers online ... Find local flower shops...

Plantation Order fresh flowers online ... Find local flower shops...

06 AI search: the door is open, the room is empty

More people now ask ChatGPT instead of Google: recommend a florist in Aventura who delivers today. The answer gets assembled from whatever the model could read. Good news, it is allowed in. Bad news, there is nothing to read.

ALREADY GOOD

AI crawlers are allowed on the site

Your settings explicitly permit GPTBot, which is ChatGPT, along with ClaudeBot and a dozen others. A lot of shops are accidentally blocked here and spend years not understanding why they never appear in answers. Yours is set up correctly. Leave it.

FIX FIRST

No card for AI to read the facts from

There is a simple file called `llms.txt`. It says in plain language who you are, where you are, which areas you deliver to, how late you take an order for same day delivery, what delivery costs, what you do for Shabbat and the Jewish holidays, and how to order a corporate subscription.

A model takes those facts ready made. Without the file it digs them out of your markup, gets your hours and prices wrong, or simply prefers the competitor who has one. We checked three possible addresses. **None of them exists.**

check

/llms.txt missing

/llms-full.txt missing

/ai.txt missing

meanwhile these are allowed in:

GPTBot · ClaudeBot · CCBot · Amazonbot · DeepSeekBot · +9 permitted

07 The site itself: everything else we found

WHAT	WHAT IT MEANS IN PLAIN TERMS	HOW MUCH IT MATTERS
No Russian version	Not a single page in Russian. In Sunny Isles, Aventura and Hollywood that is your direct customer, and they search in Russian. There is noticeably less competition there.	Large lost revenue
The home page jumps while loading	Images on the home page have no dimensions set and no lazy loading. On a phone someone aims for a button, an image finishes loading, everything shifts, and the finger lands somewhere else. On product pages, incidentally, this is done correctly.	Noticeable
The home page does not unfurl in messengers	Send a link to a bouquet and a proper card with a photo appears. Send a link to the site itself or to a city and you get a bare line of text. For a business where people share links constantly, that stings.	Noticeable
The FAQ page	Carries the same title as the home page, so the two compete against each other in search. And only one question is marked up out of all of them.	Quick fix
No articles at all	220 products and zero text. Seasonal demand around Mother's Day, Valentine's, weddings, graduations, Shabbat and the Jewish holidays comes from people who read first and buy after. Right now they are reading somebody else. We cover this, see "Ongoing work".	Lost revenue
The site is behind bot protection	An ordinary browser sometimes gets an empty page back. Search crawlers are let through, we verified that. But it is worth watching: if the settings change, you disappear from AI and from search without any warning.	Keep an eye on it

08 What we would build

Three layers. Each works on its own, and each one makes the previous stronger: the first brings people in, the second stops them leaving, the third brings them back.

You can take them one at a time and in any order.

LAYER 1 • WHERE PEOPLE START

A business a machine can read

\$2,900

So that Google and ChatGPT both know you deliver to Aventura by evening, and can tell that to the person asking. Right now neither of them knows it.

- **The AI card**, llms.txt plus the long version: delivery area, timings, prices, hours, Shabbat, corporate orders
- **20 neighborhood pages** with genuinely local text, starting with Aventura and the coastal strip
- Every town already listed in your delivery area
- Machine readable markup on every neighborhood page
- The misspelled city removed, titles and descriptions fixed on the 14 you have
- Home page images, and links that unfurl properly in messengers

4 to 5 weeks • then it keeps working with nothing more to pay

LAYER 2

An agent that takes the order

\$2,400

It answers on WhatsApp and on the site around the clock, in English and Russian. It picks an arrangement by occasion and budget, checks the address against your delivery area and whether you can still make it today, offers a card or balloons, and carries it through to payment.

Night and weekend enquiries stop disappearing. Anything complicated goes to a person, and **it does not pretend to be you**.

3 to 4 weeks • then ongoing support

LAYER 3

A system that remembers the customer

\$2,200

Someone orders flowers for his wife's birthday on 14 March. A year later, on 7 March, a message reaches him on its own: shall we do it again, last time it was peonies. This is not a newsletter. It is his own date.

In this business the dates repeat every year. It is the cheapest repeat order that exists and you are not collecting it. The same layer sends the buyer a photo of the delivered arrangement and asks for a review a day later.

3 to 4 weeks • we build the date list from orders you already took

All three together

Worth taking as one piece: the agent leans on the delivery area from the first layer, and the memory leans on the orders the agent puts through.

\$6,900

instead of \$7,500

09 When it pays for itself

Counted at your own prices

The four bouquets currently shown on every city page, \$119, \$357, \$349 and \$159, average **\$246 an order**.

Layer 1, \$2,900

12 orders

Layer 2, \$2,400

10 orders

Layer 3, \$2,200

9 orders

All three, \$6,900, once

28 orders

That is the threshold on revenue, not profit. Only you know your margin, so put your own number in and these will move. And the difference from advertising: twenty two neighborhood pages and a working agent get built once and carry on bringing people in long after the budget is spent.

10 Ongoing work

What gets built needs looking after: checking the agent answers correctly, adding areas as your delivery grows, watching what AI actually says about you. No long

contract. It stops any month you want.

PLAN	WHAT IT COVERS	PRICE
Watch	We check what ChatGPT, Perplexity and Google's AI answers say about you, track your positions by area, and fix what breaks. A report in plain language once a month.	\$600/mo
Grow recommended	Everything in Watch, plus work on the agent, where we go through real conversations and sharpen it, two new areas a month, and preparation for the peaks (Valentine's, Mother's Day) ahead of time rather than in the last week.	\$1,200/mo
Seasonal content separate	Four pieces a month for the occasions coming up, plus product descriptions. With local specifics: what Surfside orders for Shabbat, what people buy for a quinceañera, what we can still get to Aventura by evening. Otherwise it turns into the same thing we criticised your city pages for.	\$400/mo

We found more problems on the site than we put in this proposal. The main one is organic search, and that is where we suggest starting. The rest, a Russian version, speed, product descriptions, corporate subscriptions for hotels and restaurants, paid acquisition, a full CRM, is faster to talk through in twenty minutes than to write out here.

11 One thing to check before we start

Your site runs on BloomNation. It is a ready made platform for florists, and part of the first layer depends on what access it gives you: whether the AI card can go in the root of the site, whether crawler settings can be edited, whether you can add your own blocks and create new neighborhood pages.

Judging by the pages you already have, some of that access is clearly there. But before anyone signs an estimate, we will find out the exact scope **at our own cost**, which is one conversation with their support. If the platform will not allow something, we take it out of the estimate and lower the price rather than pretending it got done. Layers two and three do not depend on the platform at all.

12 How we start

- 1 **A twenty minute call.** Where you actually deliver and until what time, which areas bring the best order value, what people order most, how orders are taken now and what gets lost. Without that there is no local text and no agent.
- 2 **We check platform access.** At our cost, before the estimate.
- 3 **We agree the layers and the timing.** Half up front, half on delivery.
- 4 **Aventura and the coastal strip go first.** Closest to you, highest order value, fastest to show a result.
- 5 **A month in we look at the numbers** and decide whether to go to the second layer.
